Title: Seidl: Programmoptimierung (14.01.2013)

Date: Mon Jan 14 14:00:22 CET 2013

Duration: 93:05 min

Pages: 53

4. Generalization to a Logic

Disjunction:

$$\neg ((x - 2y = 15 \wedge x + y = 7) \vee (x + y = 6 \wedge 3x + z = -8))$$

Quantors:

$$\exists x : z - 2x = 42 \wedge z + x = 19$$

718

4. Generalization to a Logic

Disjunction:

$$(x - 2y = 15 \wedge x + y = 7) \vee (x + y = 6 \wedge 3x + z = -8)$$

Quantors:

$$\exists x : z - 2x = 42 \wedge z + x = 19$$

Presburger Arithmetic

719

Mojzesz Presburger, 1904–1943 (?)

720

721

73

Presburger Arithmetic = full arithmetic without multiplication

Presburger Arithmetic = full arithmetic without multiplication

Arithmetic : highly undecidable
even incomplete :-

- Hilbert's 10th Problem
- Gödel's Theorem

723

72

Presburger Formulas over \mathbb{N} :

$$\begin{aligned}\phi ::= & \quad x + y = z \mid x = n \mid \\ & (\phi_1 \wedge \phi_2) \mid \neg\phi \mid \\ & \exists x : \phi\end{aligned}$$

$$3x + y = 5 \quad \leftrightarrow$$

$$\exists x_1, x_2, z. \quad x + x = x_1 \wedge x_1 + x = x_2 \wedge \\ x_2 + y = z \wedge z = 5)$$

724

Presburger Formulas over \mathbb{N} :

$$\begin{aligned}\phi ::= & \quad x + y = z \mid x = n \mid \\ & \phi_1 \wedge \phi_2 \mid \neg\phi \mid \\ & \exists x : \phi\end{aligned}$$

Goal: PSAT

Find values for the free variables in \mathbb{N} such that ϕ holds ...

725

$\text{PSAT} \leq \text{DSPACE}(2^{2^{c \cdot n}})$

Fischer, Rabin,1974 :

$\text{PSAT} \geq \text{NTIME}(2^{2^{c \cdot n}})$

745

3.3 Improving the Memory Layout

Goal:

- Better utilization of caches
 - reduction of the number of cache misses
- Reduction of allocation/de-allocation costs
 - replacing heap allocation by stack allocation
 - support to free superfluous heap objects
- Reduction of access costs
 - short-circuiting indirection chains ([Unboxing](#))

746

1. Cache Optimization:

Idea: local memory access

- Loading from memory fetches not just one byte but fills a complete cache line.
- Access to neighbored cells become cheaper.
- If all data of an inner loop fits into the cache, the iteration becomes maximally memory-efficient ...

747

Possible Solutions:

- Reorganize the data accesses !
- Reorganize the data !

Such optimizations can be made fully automatic only for arrays :-)

Example:

```
for (j = 1; j < n; j++)  
    for (i = 1; i < m; i++)  
        a[i][j] = a[i - 1][j - 1] + a[i][j];
```

748

a_{11}

Possible Solutions:

- Reorganize the data accesses ! a_{11}
- Reorganize the data !

a_{21}

Such optimizations can be made fully automatic only for arrays :-)

Example:

```
for (j = 1; j < n; j++)  
    for (i = 1; i < m; i++)  
        a[i][j] = a[i - 1][j - 1] + a[i][j];
```

748

- At first, always iterate over the **rows**:
- Exchange the ordering of the iterations:

```
for (i = 1; i < m; i++)
    for (j = 1; j < n; j++)
        a[i][j] = a[i - 1][j - 1] + a[i][j];
```

When is this permitted???

749

- At first, always iterate over the **rows**:
- Exchange the ordering of the iterations:

```
for (i = 1; i < m; i++)
    for (j = 1; j < n; j++)
        a[i][j] = a[i - 1][j - 1] + a[i][j];
```

When is this permitted???

749

Possible Solutions:

- Reorganize the data accesses !
- Reorganize the data !

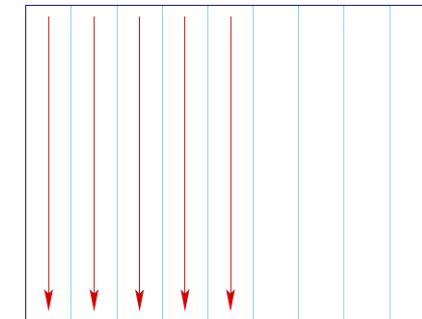

Such optimizations can be made fully automatic only for **arrays** :-)

Example:

```
for (j = 1; j < n; j++)
    for (i = 1; i < m; i++)
        a[i][j] = a[i - 1][j - 1] + a[i][j];
```

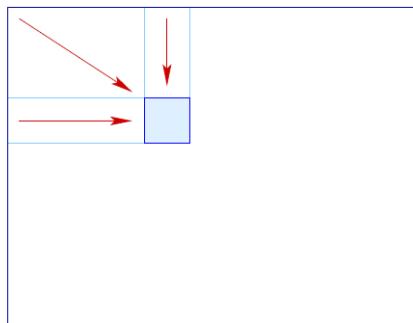

748

Iteration Scheme: before:

750

Iteration Scheme: allowed dependencies:

752

In our case, we must check that the following equation systems have **no** solution:

Write	Read
$(i_1, j_1) = (i_2 - 1, j_2 - 1)$	
$i_1 \leq i_2$	
$j_2 \leq j_1$	
$(i_1, j_1) = (i_2 - 1, j_2 - 1)$	
$i_2 \leq i_1$	
$j_1 \leq j_2$	

The first implies: $j_2 \leq j_2 - 1$ Hurra!

The second implies: $i_2 \leq i_2 - 1$ Hurra!

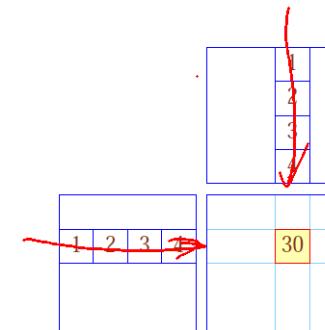

753

Example: Matrix-Matrix Multiplication

```
for (i = 0; i < N; i++)
    for (j = 0; j < M; j++)
        for (k = 0; k < K; k++)
            c[i][j] = c[i][j] + a[i][k] * b[k][j];
```

Over $b[]$ the iteration is **columnwise** :-)

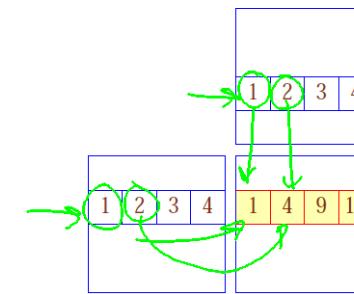

754

755

Exchange the two inner loops:

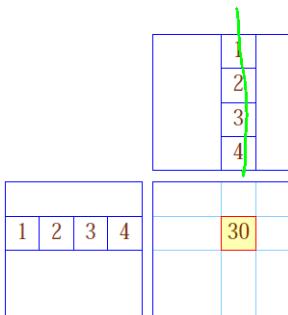

```
for (i = 0; i < N; i++)  
    for (k = 0; k < K; k++)  
        for (j = 0; j < M; j++)  
            c[i][j] = c[i][j] + a[i][k] · b[k][j];
```

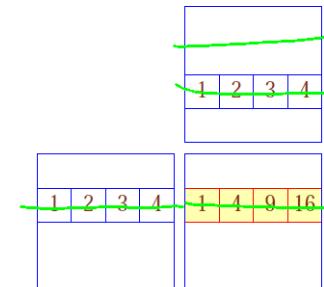

Is this permitted ???

756

757

755

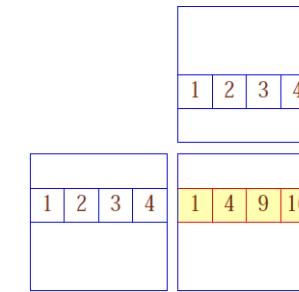

757

Exchange the two inner loops:

```
for (i = 0; i < N; i++)
    for (k = 0; k < K; k++)
        for (j = 0; j < M; j++)
            c[i][j] = c[i][j] + a[i][k] · b[k][j];
```

Is this permitted ???

756

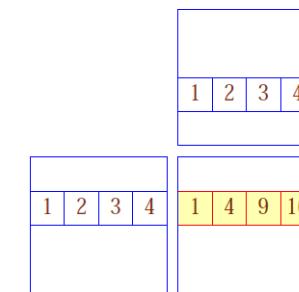

757

Discussion:

- Correctness follows as before :-)
- A similar idea can also be used for the implementation of multiplication for **row compressed** matrices :-))
- Sometimes, the program must be **massaged** such that the transformation becomes applicable :-()
- Matrix-matrix multiplication perhaps requires initialization of the result matrix first ...

758

757

```

for (i = 0; i < N; i++) {
    for (j = 0; j < M; j++) {
        c[i][j] = 0;
        for (k = 0; k < K; k++) {
            c[i][j] = c[i][j] + a[i][k] · b[k][j];
        }
    }
}

```

- Now, the two iterations can no longer be exchanged :-()
- The iteration over j , however, can be **duplicated** ...

759

```

for (i = 0; i < N; i++) {
    for (j = 0; j < M; j++) c[i][j] = 0;
    for (j = 0; j < M; j++) {
        for (k = 0; k < K; k++) {
            c[i][j] = c[i][j] + a[i][k] · b[k][j];
        }
    }
}

```

Correctness:

- ⇒ The read entries (here: no) may not be modified in the remaining body of the loop !!!
- ⇒ The ordering of the write accesses to a memory cell may not be changed :-)

760
