Title: Seidl: Virtual_Machines (07.07.2015)
Date: Tue Jul 07 10:20:43 CEST 2015
Duration: 18:05 min
Pages: 9

In particular, the local variables reside in the new block ...

⇒ We address ...

- the formal parameters relatively to the frame-pointer;
- the local variables relatively to the stack-pointer :-)

⇒ We must re-organize the complete code generation ... :-()

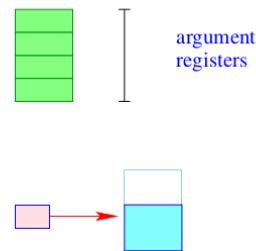

Alternative: Passing of parameters in registers ... :-)

⇒ We address ...

- the formal parameters relatively to the frame-pointer;
- the local variables relatively to the stack-pointer :-)

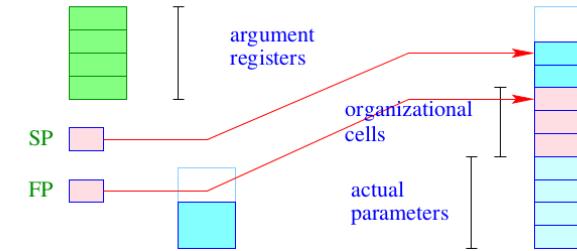

⇒ We must re-organize the complete code generation ... :-()

Alternative: Passing of parameters in registers ... :-)

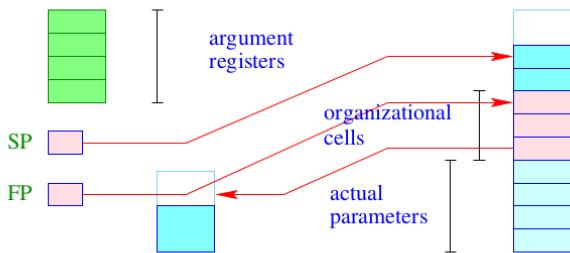

The values of the actual parameters are determined **before** allocation of the new stack frame.

467

The **complete** frame is allocated inside the new block – plus the space for the current parameters.

468

Inside the new block, though, we must store the old **SP** (possibly +1) in order to correctly return the result ... :-)

469

3. Idea: Hybrid Solution

- For the first k threads, we allocate a separate stack area.
 - For all further threads, we successively use one of the existing ones !!!
- ====
- For few threads extremely **simple** and **efficient**;
 - For many threads **amortized** storage usage :-))

470
